

# FLOWZEN

## Customer Discovery Preparation Guide

**For:** Piyush & Harshad

**Stage:** First outreach batch completed — 5 companies contacted

### 1. Where We Are

We have completed the first outreach batch. Five companies were contacted with personalized research emails. The purpose is **not to sell a finished product**; it is to understand real repetitive workflows before deciding what Flowzen should build.

| Company             | Industry      | Status     |
|---------------------|---------------|------------|
| CargoLink           | Logistics     | Email sent |
| Kathat Logistics    | Logistics     | Email sent |
| NCUBE Logistics     | Logistics     | Email sent |
| Sahyadri Industries | Manufacturing | Email sent |
| ABHI-TECH           | Manufacturing | Email sent |

### 2. Main Objective

**Find out what is actually true.** We are looking for a specific repetitive workflow that is frequent, painful, measurable, and potentially suitable for automation while keeping humans in control.

The strongest outcome is a company showing us a real workflow and allowing us to understand it well enough to consider a prototype or pilot.

### 3. If a Company Replies

Bring the exact reply here before responding when possible. Do not immediately pitch features, pricing, or a large AI solution. Our first objective is a short **15–20 minute discovery conversation**.

### 4. 15–20 Minute Discovery Questions

| Stage       | Question                                                                                             |
|-------------|------------------------------------------------------------------------------------------------------|
| Opening     | Could you walk me through one repetitive process your team handles regularly, from beginning to end? |
| Process     | What happens first? What happens next?                                                               |
| Tools       | Which software, spreadsheets, email, ERP or CRM tools are involved?                                  |
| Frequency   | How often does this happen — daily, weekly, or monthly?                                              |
| Time        | Approximately how much time does one case take?                                                      |
| People      | How many people are involved?                                                                        |
| Manual work | Where are people repeatedly copying, checking, entering, or preparing information?                   |
| Pain        | Where do delays, mistakes, or back-and-forth usually happen?                                         |

| Stage          | Question                                                                              |
|----------------|---------------------------------------------------------------------------------------|
| Human judgment | Which decisions need a person to review or approve?                                   |
| Priority       | If you could remove one repetitive part of this process, which part would you choose? |

## 5. What We Need to Record

| Field                 | Record                                                      |
|-----------------------|-------------------------------------------------------------|
| Company / person      |                                                             |
| Industry              |                                                             |
| Workflow name         |                                                             |
| Trigger               | What starts the process?                                    |
| Step-by-step process  | Record the actual sequence.                                 |
| Frequency             |                                                             |
| Time per case         |                                                             |
| People involved       |                                                             |
| Systems / tools       |                                                             |
| Repeated manual work  |                                                             |
| Delays / errors       |                                                             |
| Human approval points |                                                             |
| Data involved         | Avoid collecting unnecessary personal or confidential data. |
| Current workaround    |                                                             |
| Desired improvement   |                                                             |
| Potential automation  |                                                             |
| Measurement           | What before/after metric could show improvement?            |

## 6. What Makes a Workflow Interesting?

| Signal         | Evidence to look for                                   |
|----------------|--------------------------------------------------------|
| Frequency      | It happens often enough to matter.                     |
| Time           | Employees spend meaningful time on it.                 |
| Repetition     | Steps are similar across cases.                        |
| Rules          | At least part follows understandable rules.            |
| Systems        | Software interaction is involved.                      |
| Pain           | Delays, cost, errors, or frustration are clear.        |
| Human boundary | We can identify what should remain human.              |
| Measurement    | A realistic before/after metric exists.                |
| Willingness    | The company is willing to discuss or test improvement. |

## 7. Example Workflow

**Example only — not a claim about any contacted company:**

Customer Email → AI Classification → Information Extraction → Business Rules → Human Approval  
→ System Action → Logging

For each real company, map the actual process. Separate steps into **potentially automatable**, **human review/approval**, and **human-only judgment**.

## 8. What We Must NOT Do

- Do not claim customers, revenue, production deployments, or measured savings that we do not have.
- Do not promise guaranteed ROI or guaranteed automation results.
- Do not ask for passwords, credentials, private customer data, or unnecessary personal information.
- Do not force an AI solution onto a workflow that does not need it.
- Do not build the MVP before understanding the real workflow.
- Do not keep redesigning the website simply because we are waiting for replies.

## 9. After the First Useful Conversation

1. Clean the notes.
2. Map the real workflow step-by-step.
3. Identify repetitive/manual steps.
4. Mark human approval and judgment points.
5. Estimate time/cost where possible.
6. Identify a small automation opportunity.
7. Bring the workflow for review.
8. Decide whether it is worth prototyping.
9. If appropriate, propose a small pilot.

## 10. Validation Path

**Idea → Outreach → Business Conversation → Real Workflow → Problem Validation →  
Prototype → Pilot → Measurement → Case Study → Payment**

## 11. Piyush & Harshad

**Both:** review replies, join important conversations where possible, and agree on what the workflow actually means.

**Piyush:** maintain discovery notes, workflow analysis, technical feasibility questions, and project documentation.

**Harshad:** help with company communication, practical business context, and appropriate follow-ups.

Roles can change; learning from the company is the priority.

## 12. Current Status & Next Milestone

- Website deployed
- GitHub organized
- README updated
- Outreach material prepared
- 5 personalized emails sent

■ Waiting for responses

■ **Next milestone: one genuine business conversation + one real workflow**

**One real workflow is more valuable than another 10 website features.**
